Is the Los Angeles fire the will of God or human ignorance and ignorance? - Temple of Literature - World Wide Blog - World Wide Reader Network (computer version)

On January 7, just after the New Year of 2025, a strong wind repeatedly swept through Los Angeles. Unexpectedly, within hours of nightfall, dozens or hundreds of flames began to ran inside and outside the city and on the hillsides of most hills. As usual, I was still walking under the trees after nightfall, but I felt that the wind was too strong and I was trembling all over. Under the light, I suddenly caught a glimpse of the dust. I had to go home quickly. Looking at the backyard casually, I saw the fire on the hillside. However, this does not disturb my routine. At this time, the power supply had been cut off. I lit a candle, washed up and went to bed. My dog kept barking, and there was a whistling sound of the wind shaking the doors and windows outside, but I still went to sleep as usual.

Readers, please read my experience patiently, and may understand my description and the following explanation. After more than 30 years of many baptisms of Nanka Fire, I have watched it more than ten times in the backyard window alone. I have long become insensitual and used to it. Frankly speaking, the first time I saw the fire was near Newport Beach, which was really a shocking day. Later, the longer I lived, the more frequent I went to the nearby national park, the more fire I saw and its ruthless evolution. Slowly, I transitioned from surprise, panic, to understanding, expectation, and even a little appreciation. The more we

understand nature from a scientific perspective, the more we fear the magic of nature and the mastery of God. Humans are really nothing. I believe that like me, there must be many people who hold the above views in the south.

After midnight, the power was restored, and I was woken up by the shining lights. The mobile phone has been blown up, and almost all of the news of the fire. Now, just a week has passed, and the fire has disappeared. That is, at the moment when I picked up the pen, the fallen trees in the backyard were still full of swimming pools, but the sky was already blue and white clouds. The branches on the main roadside have been cleaned up, and Los Angeles has returned to the busyness of the past. I must admit that this fire gave me a new understanding of the fire caused by the Santa Ana Winds. Places that were originally considered relatively safe, such as high-end residential areas near Hollywood, can also be done in a few hours. From a human perspective, the fire is a disaster. The victims deserve sympathy and assistance, and the rescue work is far from over. How to appease or mock is not the focus of this article. As a witness, my original intention is to look at the fire rationally with a scientific attitude, spread the correct information, learn from the fire, and minimize the next loss. If a fire in South Canada makes the world more ignorant and ignorant, this is a phenomenon that many people do not want to see.

The reason is very simple. Last week's fire has disappeared, but the fire on the Internet is getting more and more. I was awakened by the sound of questions and greetings every morning and evening, and it was really difficult for me to stand it. I thank these friends from all over the world for their concern and greetings from the bottom of my heart. Maybe some people want to confirm the propaganda on the Internet, but some words are not easy to say. I hope my friends can see this article: I'm fine, and I like to see the fire in the backyard. In my lifetime, I will stay in the City of Angels or Nanka to share with you the Mediterranean climate, delicious

food and countless beaches, ski resorts and many nearby national parks.

I have to say that the noise on the Internet of the Los Angeles fire, the proliferation of exaggeration and lies is unprecedented and breathtaking. Naturally, there are a lot of questions and doubts in the United States, and the noise of the simple and Chinese media is even more exciting. The posts of Xinkou Kaihe River, the pictures and videos synthesized by AI are overwhelming, stirring up the fire, lest the world of the United States will not be chaotic. The claim that the fire has hit California and the United States is already insigniful. Some people assert that this fire cannot be extinguished, and some analysts say that the fire every year is due to the system or the result of bipartisan disputes; without strong party leadership, governors and mayors are scared away, some people say that there is no firefighting funds, and the money goes to Ukraine, and People compare the 2022 Chongqing wildfire, which was extinguished in eight days, with the Los Angeles fire: under the leadership of the Party, "the wildfire was extinguished in just eight days, and the blood, will and unity of the Chinese people when facing the disaster were extremely brilliant... The United States has broken through the defense. There are all kinds of everything. Some people also analyzed the fire from the perspective of God. In a word, it makes you sure that whether in the United States or the world, it is "rises from east to west".

There is no fault for discussing fire with a rational and scientific attitude. Since it is said that it is such a major residential disaster, to be honest, the number of known deaths so far is only more than 20 people, which shows that the measures mobilized and publicized by the police and the community in times of crisis are decisive, effective and powerful, which is commendable. I have been waiting. So many people like to study comparatively and see the greatness of the motherland in the fire. Has anyone compared the continuous fire of Daxinganling in 1987 with "Qigong" and the Karamay fire in Xinjiang in 1994? It seems that these people are really not stupid and won't mention these examples. It can be

seen that most of those inappropriate comparisons are due to ignorance and ignorance, without in-depth thinking and investigation, and the conclusions drawn by patting their heads and the inferiority and pride of people.

As for those who have ulterior motives, I believe that netizens will more or less identify them after reading this article. As I saw the propaganda on WeChat: "Beverly Hills, the most noble Pacific coast in the world, has become the laughing of the Chinese people. The fire in Los Angeles ruthlessly burned the symbol of fame and wealth that a group of Chinese stars have worked hard to accumulate over the years - they are in Beverly Hills (is there a fire here?) The mansion. Jackie Chan, Zhang Yimou, Feng Xiaogang... (The latter has firmly denied it, laugh!). All research equipment and documents of the U.S. aerospace industry are placed in Los Angeles and paid for. If you want to resume your old career, you must start over. ...The American political community, the mainstream media, the new and the old presidents are indifferent, and the superiority of the two-party system is vividly reflected here! This fire will burn the two major symbols of American hegemony: 1) the representative and symbol of American culture, the Hollywood film industry; 2) the representative and symbol of American science and technology, NASA, the American aerospace industry. Good man, the United States is ruined again!

Netizens who carefully observed and studied put forward different views on the fire, but most of them would not be accepted by the mainstream noise on the Internet. This article provides simple scientific guidance here. Interested readers can visit California's national parks or continue to search online to find the correct and complete answer.

The terrain of California is complex and has different topography. In the north and south, different trees grow along the coast or inland. The world's tallest and longest-lived tree species grow in the northern coastal and central inland areas, and most of them are thousands of years old.

Such as The Redwood National and State Parks in the north, and Sequoia & Kings Canyon Natio in the south of Yosemite nal Parks). Obviously, they have not experienced severe fires, otherwise they would not have survived for a thousand years. However, it has indeed experienced man-made disasters. Most of the trees have been cut down for nearly a hundred years, and the rest have been protected. Modern fire prevention measures are basically in place, but the fundamental reason is that their own structure and growing environment are not prone to fires, which is mainly in contrast to Southern California. How many times have you heard that they have a fire?

Redwood National Park is located in a very humid coastal environment, and moisture is entangled all year round; while Redwood National Park is located in the inland mountains, which is relatively dry, but the trunk and bark contain natural fireproof materials, which is actually not easy to catch fire. This is a relatively good statement. However, the park also has strict fire prevention measures. The chemical composition and specific precautions in the tree that prevent combustion will no longer be expanded here. There is a detailed introduction in the national park.

Southern California is a semi-desert area. The weather is usually dry and hot. Some seasons are more obvious. What's more, there is a lack of water. The famous Death Valley is located here. For thousands of years, the plant industry has developed various unique desert plants and tree species to adapt to the harsh environment here; Israel, the Middle East and some areas of China have similar landforms, not to mention ancient times. Although a small number of original residents survive here, large-scale development is a matter of nearly a hundred years. Los Angeles, the city of angels with a population of more than 10 million, developed in this harsh environment. There is no second ancient or new metropolis in the world that can be compared, which can rise in a short time and become a world model of science and technology, education, literature and art, etc. This is not to say that there is no problem in California or Los

Angeles, and there is no shortage or omission of partisan and political figures, but these require science, justice and mature public opinion and open discussion to identify, and are by no means the screams or howls from the closed prison.

China and many parts of the world have heard stories of knife cultivation. The stability of knife cultivation depends mostly on the nutrients provided by the entire ecosystem. Unlike the redwood or redwood national park area, large areas of plants in Southern Canada have also developed a unique biological reproduction ecosystem in long-term evolution. Many plants contain ingredients that help burn, and usually reach the peak of maturity in winter. There is very little rainfall near Los Angeles, mostly concentrated in winter and spring. When the driest season, encountering strong winds, encountering accumulated dry branches, and flammonizing substances, it is easy to cause wildfires. The tightly wrapped seeds can be returned to the soil and obtain a large amount of nutrients after burning, waiting for the rainy season to sprout and grow. The cycle of nature has lasted for millions of years, which is the will of God and the law of nature. You can visit Joshua Tree National Park and many state parks for more scientific information. It is worth mentioning that in the winter and spring season of 2024, the rainfall in Southern Canada is much greater than in previous years, and a large number of bare vegetation appears, which also lays the foundation for this year's fire.

Human development and entry have changed the ecosystem of parts of Southern Canada. Over the past hundred years, the Greater Los Angeles area has introduced and planted a large number of ornamental trees, which need a lot of moisture nourishment. All of them have the Hoover Dam and the introduction of water from the Colorado River. In addition, there are countless storage and water-saving systems, which is beyond the scope described in this article. The establishment of an artificial system has undoubtedly greatly reduced the frequency and scope of

natural wildfires. It is difficult to compare the specific figures with the previous ones, because not many people lived there and scientific records before. The area of the area is very large, and a large number of primitive mountain tops are still scattered in the center and surroundings of more than 200 cities. This is an intentional preservation of the ecological environment, and there are also reasons for viewing. Because of the limited water resources, it is impossible to destroy all desert plants in Greater Los Angeles. Therefore, most areas are mixed with primitive and artificial plants, which is actually one of the characteristics of Nanga.

The media in many mainlands are noisy. If the great party is in power, the Southern Fire will not occur every year, let alone out of control. In fact, no big city in China is comparable to Los Angeles, and it is difficult to find in the world. Some netizens found the official record (California Miracle: Wildfires are getting more and more prosperous). The University of California recorded wildfire statistics from 1987 to 2023. Please note that the ecology of various regions in California is different and there is continuity. To the disappointment of many distant people, the annual fires here are not a singlet, but between 7,500 and more than 80,000 times. The time and place range are very arbitrary, and the maximum burning area is as high as 4.3 million acres. The area of this burning is basically a small number. Of course, the high-value residential areas along the coast were burned down, and the loss was as high as 100 billion US dollars, but they were all private property of the rich, and there may not be too many post-disaster starvation. Will the fire hit California and the United States hard? Maybe yes, as long as you like it. California's GDP has grown rapidly in the past few decades, reaching 4 trillion US dollars. In a few years, California will become the GDP TOP three, crushing all Western countries.

Why don't I go to bed and stay up late because of the noise of Jianzhong Media?

To the hypocritical sytra, I just want to say that knowing Jehovah is the beginning of wisdom. Don't use words, but use people's sinisterness and lies to stand up for the devil's tricks. Yes, there are many fires recorded in the Bible in the history of Israel. But in the evil and lewd generation, "except for the miracles of Jonah, there are no more miracles for them." Please go home, wash and sleep!

This article is a popular science article for ordinary primary school graduates and above. The scientific prevention of fires is very complicated, and if there are mistakes, it is inevitable. Professionals are welcome to add, criticize or correct. The following are photos taken in the backyard and nearby in 2020.
